

David Heaven

📍 Atlanta, Georgia 30307 📞 7145844290 ✉ davidheaven2@gmail.com

PROFESSIONAL SUMMARY

Software engineering professional with deep expertise in developing robust, scalable applications. Strong focus on team collaboration, driving projects to successful completion, and adapting to evolving requirements. Proficient in multiple programming languages, frameworks, and tools. Values delivering high-quality results and fostering productive work environment.

SKILLS

- **Programming languages:** Java, Python, Go, JavaScript, TypeScript, SQL
- **Backend and APIs:** REST APIs, Microservices, Spring, Node.js, API Design, Service Architecture
- **Delivery and Management:** Project Management, Agile, Scrum, Technical Leadership, CI/CD, DevOps, Technical Planning
- **Delivery and Management**
- **Algorithms and Engineering:** Algorithms, Data Structures, Object-Oriented Design, System Design, Distributed Systems, Concurrency, Performance Optimization
- **Cloud and Infrastructure:** AWS, Azure, Kubernetes, Docker, Terraform, Cloud Architecture
- **Delivery and Management**

WORK HISTORY

SENIOR SOFTWARE ENGINEER

04/2020 to CURRENT

Google | Atlanta, Georgia

- Designed scalable Java services and Python automation for high-volume technology platforms, applying algorithms and distributed-system patterns while advancing ownership from implementation to technical leadership.
- Led backend architecture for reliable services using Java, Python, REST APIs, and Kubernetes, improving scalability and operational consistency across large technology workloads and cross-functional product teams.
- Applied data structures, algorithm optimization, concurrency, and performance profiling to reduce processing overhead and improve response times for distributed services supporting high-scale technology products.
- Directed project planning across engineering teams by defining milestones, dependencies, technical risks, and delivery metrics, strengthening Agile execution and improving predictability for complex technology initiatives.

- Built automated testing and CI/CD workflows around Java and Python services, increasing release confidence while establishing repeatable engineering practices for reliable deployment and long-term platform maintenance.
- Developed cloud-native systems across AWS and Azure using Kubernetes, Docker, and infrastructure automation, supporting resilient technology services while expanding responsibilities across architecture and delivery.
- Mentored engineers on algorithms, system design, Java development, Python automation, and production debugging, raising technical standards while supporting career growth across software engineering teams.
- Partnered with product and engineering stakeholders to translate complex requirements into maintainable architectures, balancing project scope, technical debt, reliability, and delivery timelines across technology programs.

SOFTWARE ENGINEER

03/2019 to 03/2020

Dropbox | Austin, Texas

- Developed Java backend services and Python automation for cloud file-management workflows, applying algorithms and service-oriented design to improve reliability and scalability across technology products.
- Implemented REST APIs and distributed services with Java, SQL, Docker, and cloud infrastructure, strengthening backend capabilities while expanding ownership of production systems and technical delivery.
- Optimized data structures, algorithms, and concurrency paths in high-throughput services, reducing processing overhead and improving responsiveness for technology workloads with demanding scale requirements.
- Coordinated Agile project execution across engineering and product teams by managing technical dependencies, milestones, risks, and implementation plans for customer-facing technology initiatives.
- Built CI/CD automation and production monitoring for backend services, improving deployment consistency and operational visibility while progressing from individual development toward broader technical ownership.

SOFTWARE ENGINEER

07/2017 to 03/2019

Duolingo | Pittsburgh, Pennsylvania

- Built Java and Python services supporting education technology workflows, applying algorithms, REST APIs, and modular architecture to improve scalability and maintainability across learner-facing systems.
- Developed backend components and APIs using Java, Python, SQL, and service-oriented patterns, strengthening production reliability while expanding responsibility for architecture and feature delivery.
- Implemented algorithmic improvements for data processing and application workflows, using profiling and structured performance analysis to improve

efficiency across education technology services and pipelines.

- Collaborated with product and engineering stakeholders to break complex requirements into deliverable milestones, strengthening Agile project management and improving coordination across software initiatives.
- Created automated tests and CI/CD workflows for backend services, increasing release confidence and supporting dependable delivery practices across rapidly evolving education technology applications.
- Improved service reliability through logging, monitoring, fault analysis, and production debugging, building stronger operational practices while developing broader ownership of distributed software systems.
- Mentored peers on Java development, Python scripting, algorithms, testing, and maintainable design, contributing to technical growth while progressing toward senior-level engineering responsibilities.

SOFTWARE ENGINEER

05/2016 to 07/2017

Boeing | Charleston, South Carolina

- Developed Java software components for aerospace engineering workflows, applying object-oriented design, algorithms, and structured testing practices while building a foundation in production software engineering.
- Implemented Python automation for engineering data processing and validation, reducing repetitive manual workflows and improving consistency across aerospace technology development and analysis activities.
- Designed modular backend functionality using Java, SQL, and service-oriented patterns, improving maintainability while gaining experience with production requirements, technical documentation, and system integration.
- Applied data structures and algorithmic techniques to improve processing workflows, balancing computational efficiency, correctness, and maintainability within software supporting aerospace engineering programs.
- Supported project planning through task estimation, dependency tracking, technical documentation, and Agile coordination, developing stronger delivery discipline while progressing toward broader engineering ownership.
- Built automated validation and testing workflows for Java-based systems, improving defect detection and release quality while developing disciplined engineering practices for safety-conscious aerospace technology.

EDUCATION

Master of Science | Computer Science

06/2021

The University of Texas At Austin, Austin, TX

Bachelor of Science | Computer Science

05/2017

Georgia Institute of Technology, Atlanta, GA
